

Minutes of Meeting

Omaxe — Invoice Processing

Subject	API integration for PAN & GST compliance, vendor validation and master data
Project / Workstream	Omaxe — Invoice Processing automation
Date	<i>Not recorded in source notes — to be confirmed</i>
Prepared from	Handwritten meeting notes
Status	Draft for circulation

1. Attendees

Name	Note
Raghu	
Sandeep	
Dileep	
Udit	Main Director of the department

Designations other than Udit's were not captured in the notes; please confirm before circulation.

2. Agenda

Scope discussion for automating Omaxe's invoice processing, with the first item being API-led PAN & GST compliance checks on vendors.

3. Discussion

3.1 API Integration for PAN & GST Compliance (Item 1)

The primary requirement is API integration to validate vendor PAN and GST compliance at the point of invoice processing. Checks identified:

- **MSME certification and its category** — the vendor's MSME status must be verified along with the category: **Manufacturing / Trading / Services**.
- **CIN number verification** — verify the vendor's Corporate Identity Number.
- **Payment due date setting** — to be derived from the above (MSME status in particular drives statutory payment timelines). *Open point — flagged with a question mark in the notes.*
- **TDS calculation logic** — deduction logic to be built and driven by the verified vendor attributes, feeding overall compliance.

Delivery approach: integration to be done via a **third-party ISP / service provider** rather than built in-house. Assessed as **easy to be done** (low effort / low risk).

Note: for GST APIs this is typically a GSP/ASP-type provider. Confirm the exact provider category intended by "ISP" before the requirement is finalised.

3.2 Compliance — GST Filing Checks

- **GST filing report of vendors** — obtain and track vendors' GST filing status.
 - **Validation basis:** invoice number and a copy of **GSTR-1**, matched against the invoice submitted.
- **GST filing by Omaxe** — the same discipline applies in reverse, i.e. where **Omaxe is the vendor**, Omaxe's own GST filing must be covered.

3.3 Master Data

- **Master creation, with real-time refresh for critical data points (API-led).** Non-critical fields can remain static; critical compliance fields must be refreshed live via API.
- **Payment terms master** — payment terms to be held in a master and validated **against the terms mentioned on the invoice / PO**.
- Data points to be sourced and reconciled across: **PO, Vendor Master** and **MSME** status.

4. Decisions Taken

#	Decision
D1	PAN & GST compliance validation will be delivered through API integration , not manual checks.
D2	Integration to be routed through a third-party service provider ; effort assessed as low.
D3	Vendor validation scope to include MSME certification + category, CIN verification, TDS logic, and payment due date derivation .
D4	Vendor GST filing to be validated using invoice number + GSTR-1 copy .
D5	A master will be created, with critical data points refreshed in real time via API .
D6	Payment terms will be maintained in a master and reconciled against invoice / PO terms.

5. Action Items

#	Action	Owner	Due
A1	Shortlist and evaluate the third-party provider for PAN / GST / MSME / CIN verification APIs; confirm commercials and turnaround	TBC	TBC
A2	Define the MSME verification flow, including capture of category (Manufacturing / Trading / Services)	TBC	TBC
A3	Build CIN number verification into the vendor onboarding / invoice intake check	TBC	TBC
A4	Finalise payment due date logic (statutory MSME timelines vs. contracted terms) — open question, needs a decision	TBC	TBC
A5	Document TDS calculation logic (section-wise rates, thresholds, vendor-attribute dependencies) and map it to the compliance output	TBC	TBC
A6	Set up the vendor GST filing report; define the invoice-number-to-GSTR-1 matching rule and the exception / hold treatment	TBC	TBC
A7	Cover Omaxe's own GST filing for cases where Omaxe is the vendor	TBC	TBC
A8	Define the master data model: field list, source of truth, and which fields are "critical" (real-time API refresh) vs. static	TBC	TBC
A9	Create the payment terms master and define the validation rule against invoice / PO terms, including precedence between PO, Master and MSME status	TBC	TBC

Owners were not assigned in the source notes. Please allocate before circulation.

6. Open Questions

1. **Payment due date setting** — what is the rule? Statutory MSME timeline, PO terms, or vendor master terms, and which takes precedence?
2. **Precedence between PO, Vendor Master and MSME status** where payment terms conflict.

3. **“Third-party ISP”** — confirm the exact provider type / name intended (GSP/ASP for GST, NSDL / Protean-type for PAN, Udyam for MSME, MCA for CIN).
4. Which data points qualify as **“critical”** and therefore need real-time API refresh?
5. What is the **exception handling** when a vendor fails a compliance check — block the invoice, hold payment, or flag and proceed?

7. Next Steps

- Assign owners and target dates against the action items above.
- Confirm the provider approach (A1) — this gates most of the API-led scope.
- Close the payment due date question (A4) before TDS and payment-terms logic is built on top of it.
